Sauvegarde et restauration avec CloneZilla sur VMware Workstation Pro

Partie 1 : Préparation

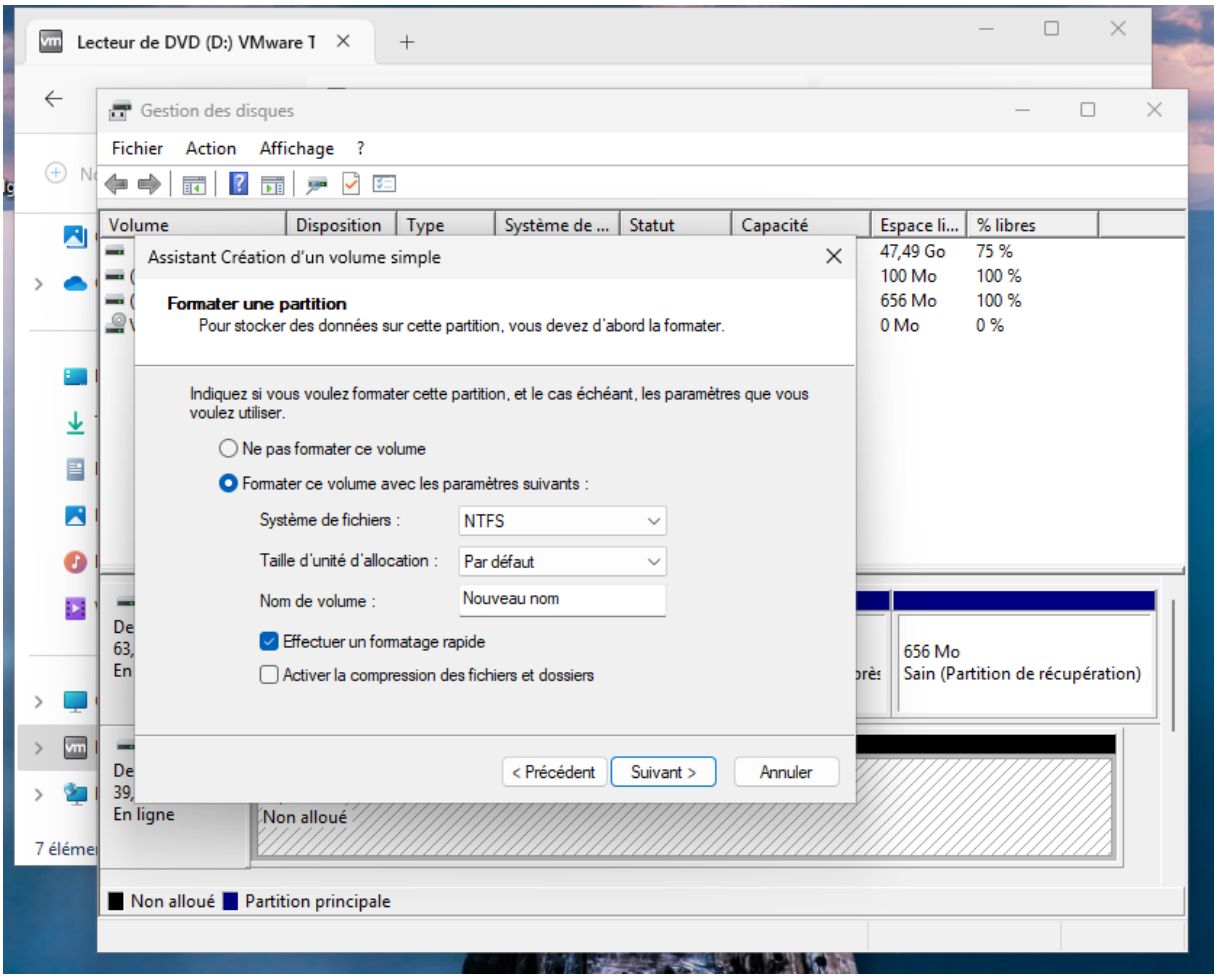

Ajout du second disque dur virtuel de 40 Go dans les paramètres de la VM.

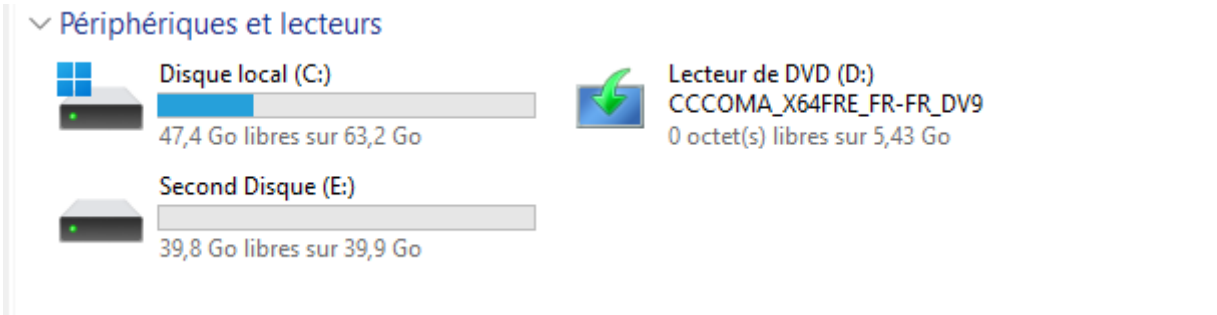

Création de la partition.

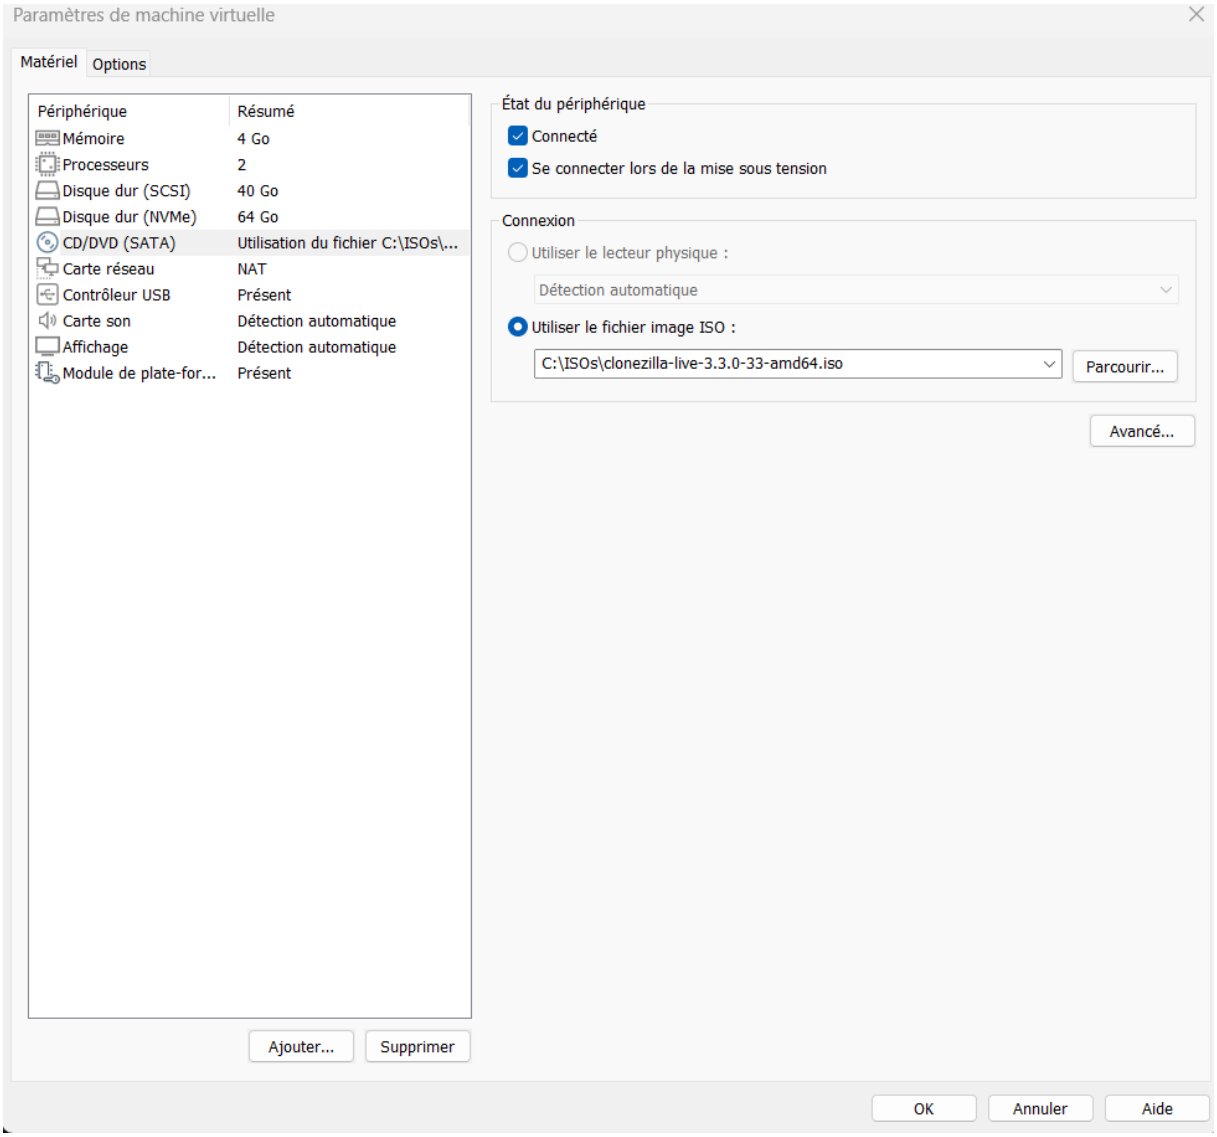

Formater en NTFS.

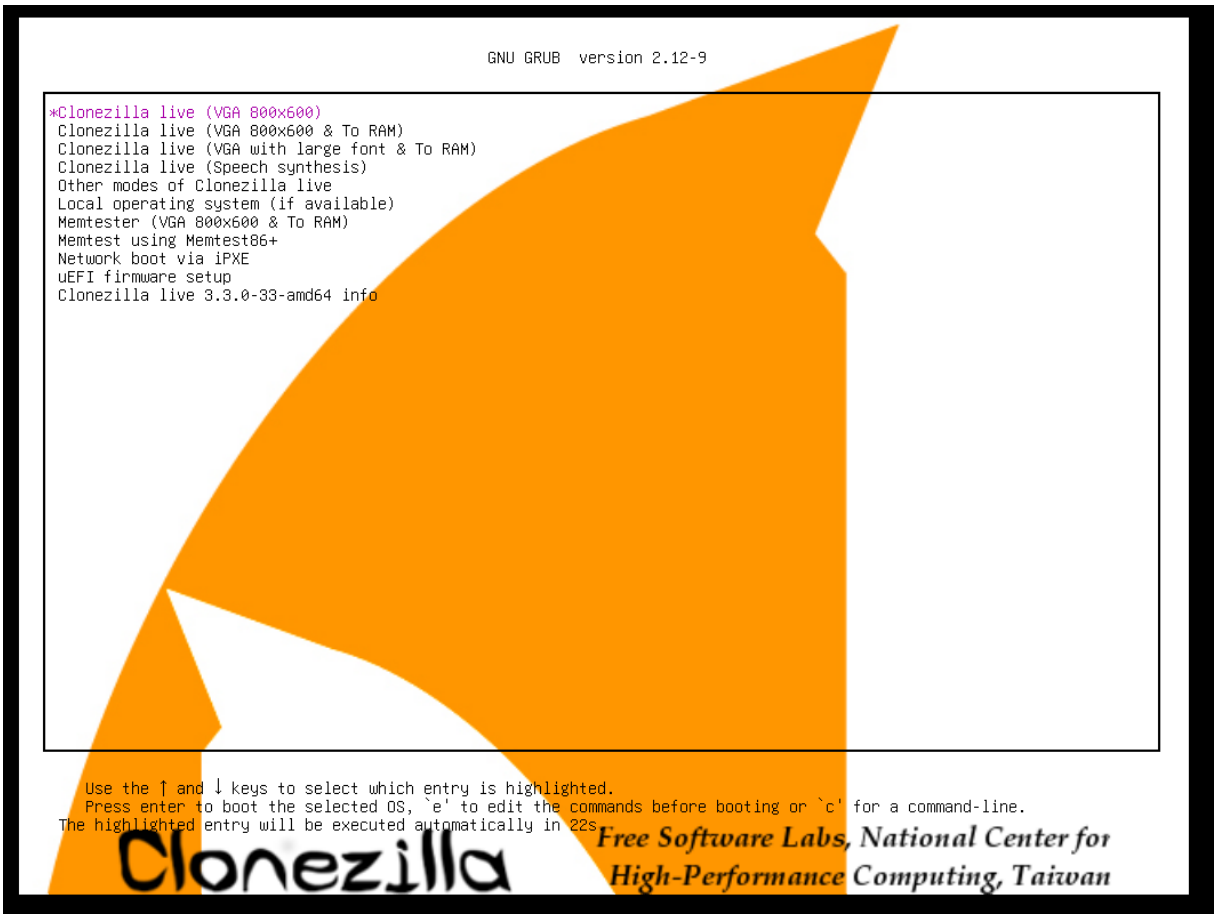

Partie 2 : Création d’une image disque avec CloneZilla

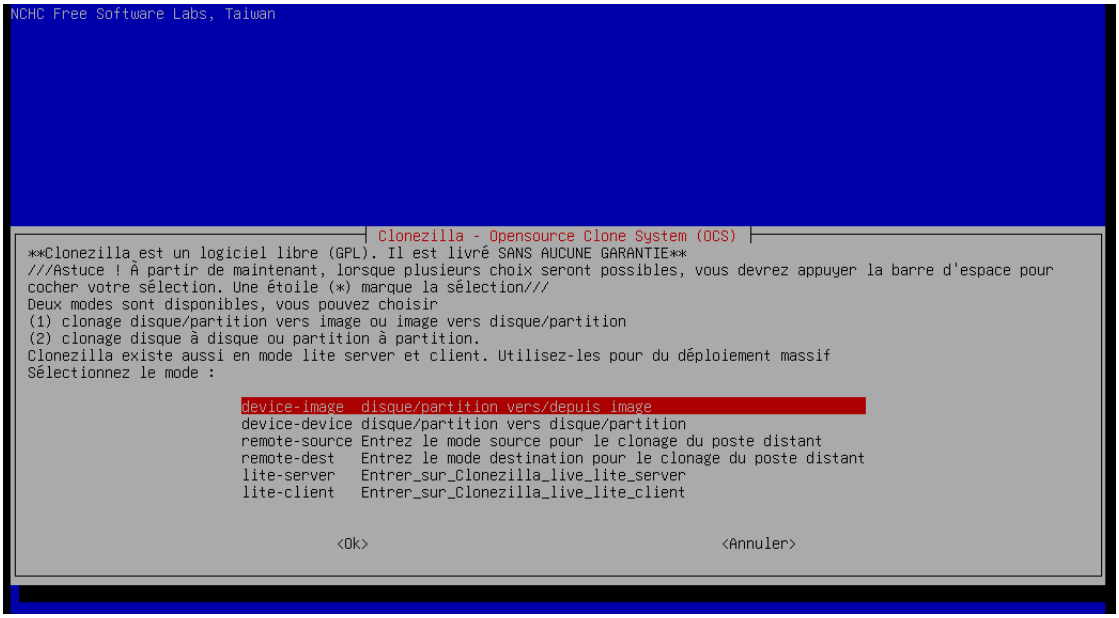

On place l’ISO dans le lecteur CD, puis via le bios (en appuyant sur « *Supr* » lorsque la machine démarre) on choisit de démarrer sur le CD.

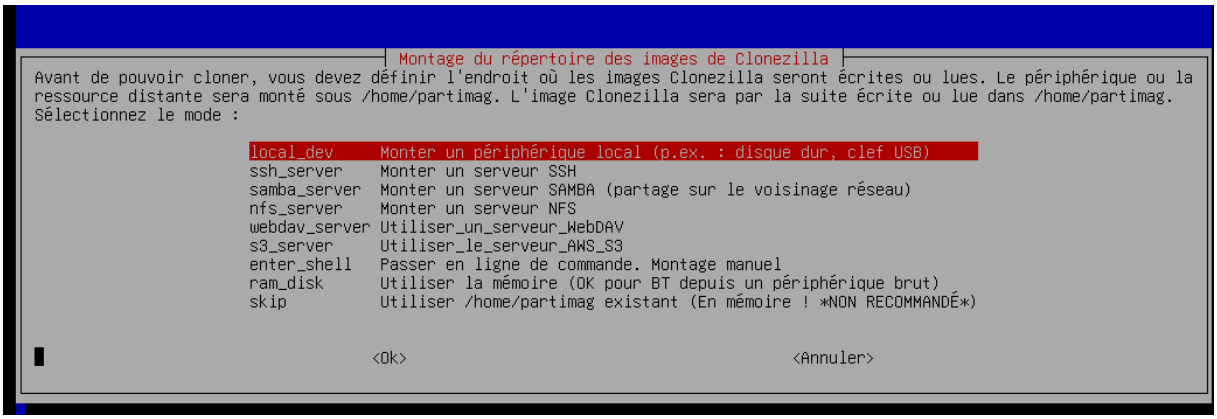

CloneZilla se lance.

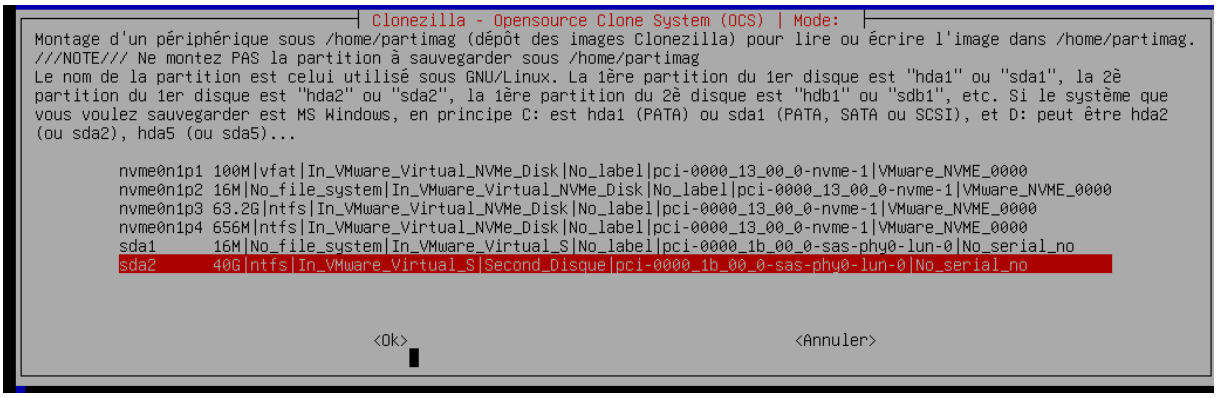

On choisit ensuite ***disque/partition vers/depuis image.***

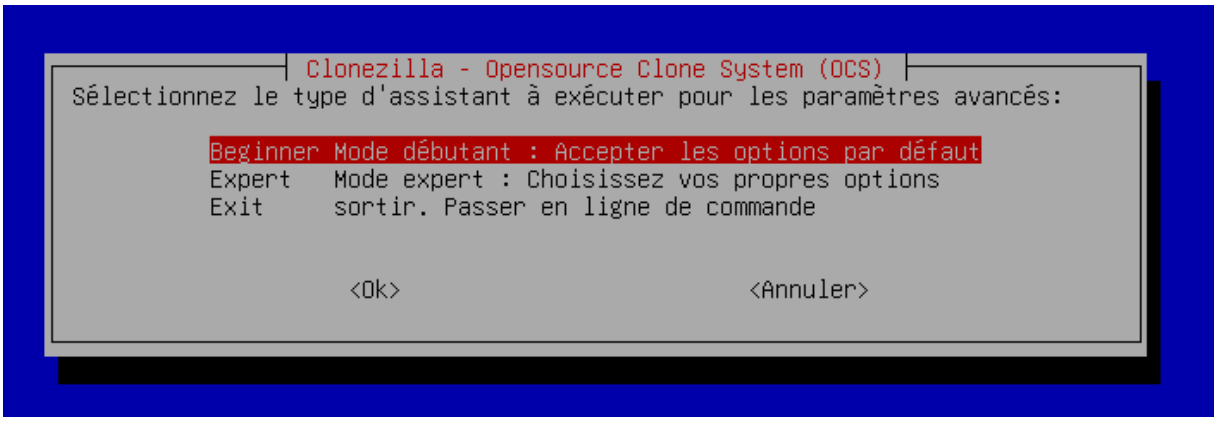

On monte un **périphérique local**.

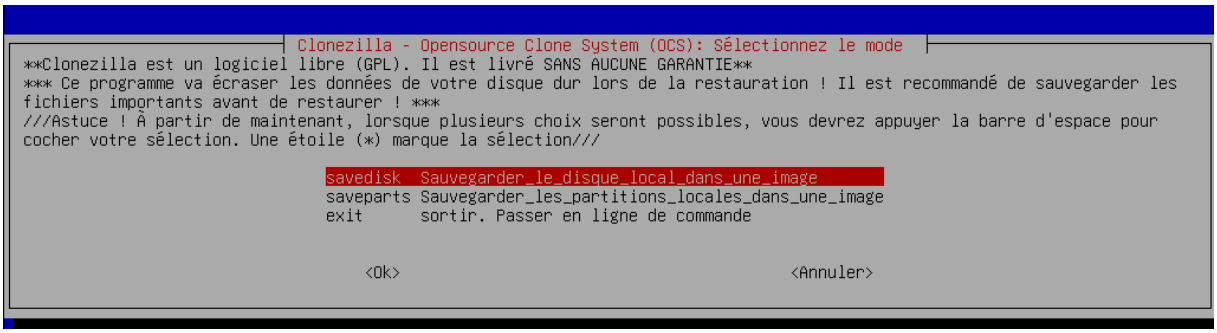

On sélectionne le bon disque.

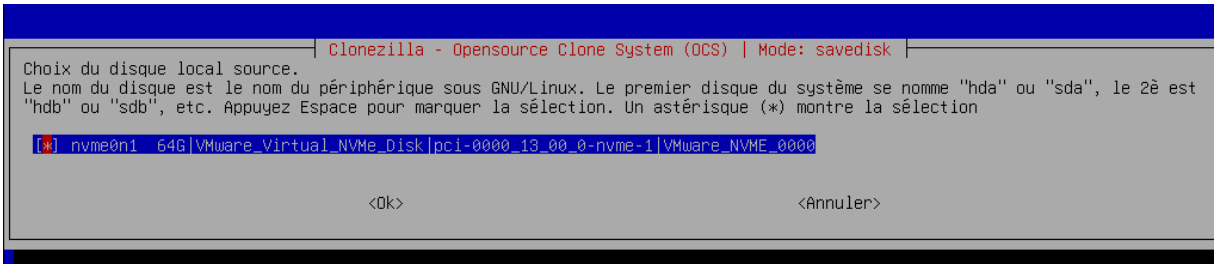

On sélectionne le mode débutant.

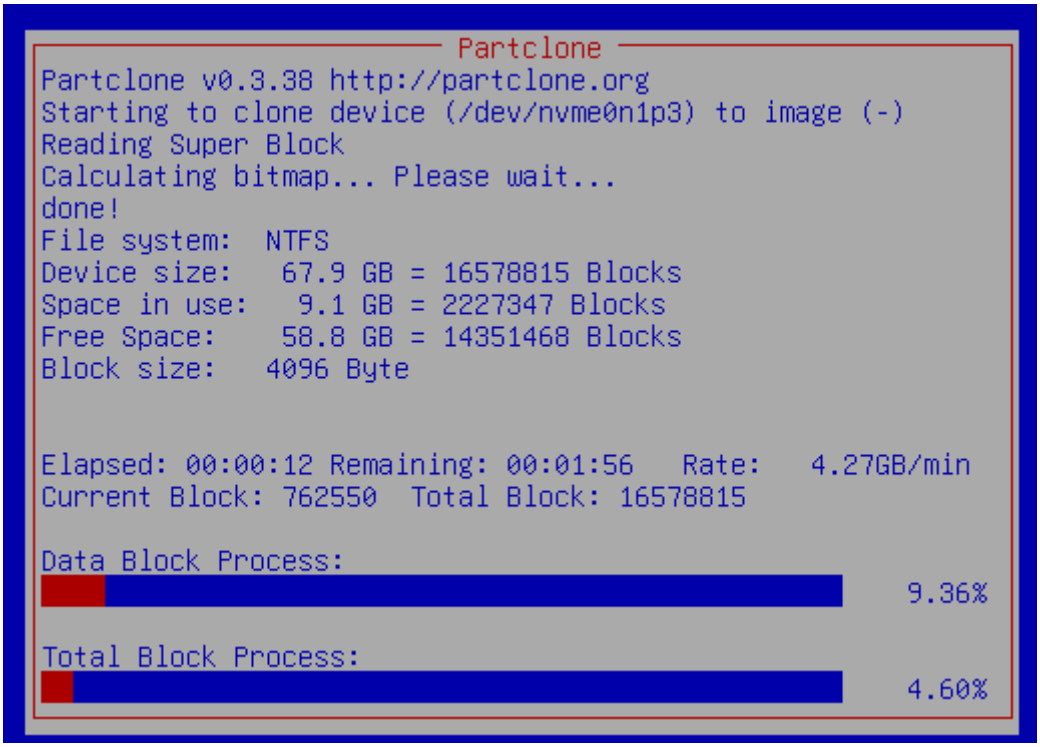

On choisit de **sauvegarder le disque local dans une image.**

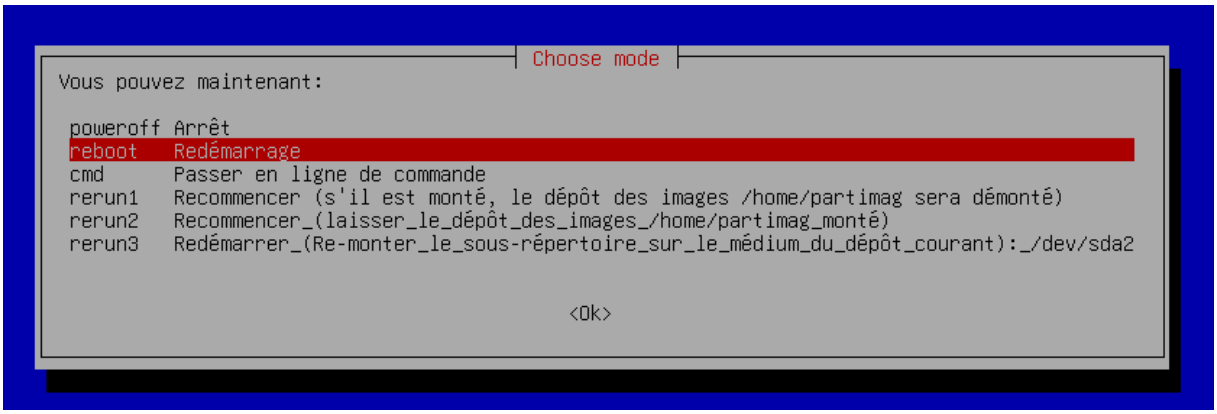

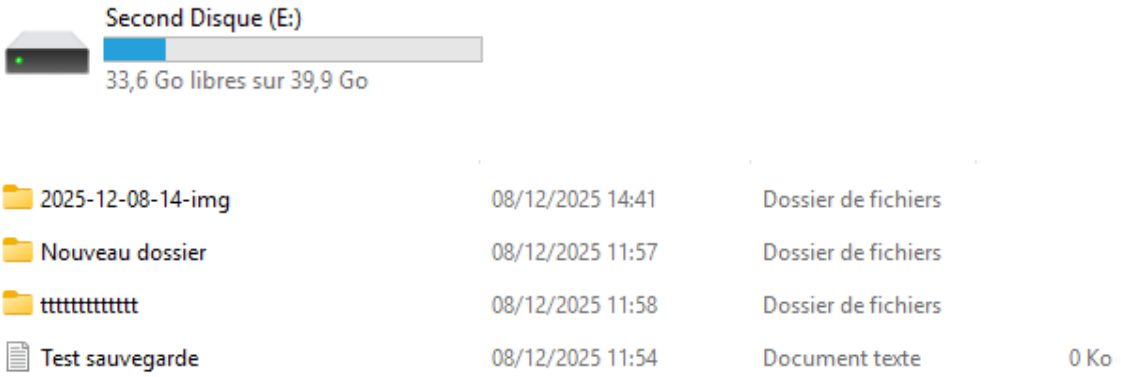

La **sauvegarde** se lance.

Et on **redémarre.**

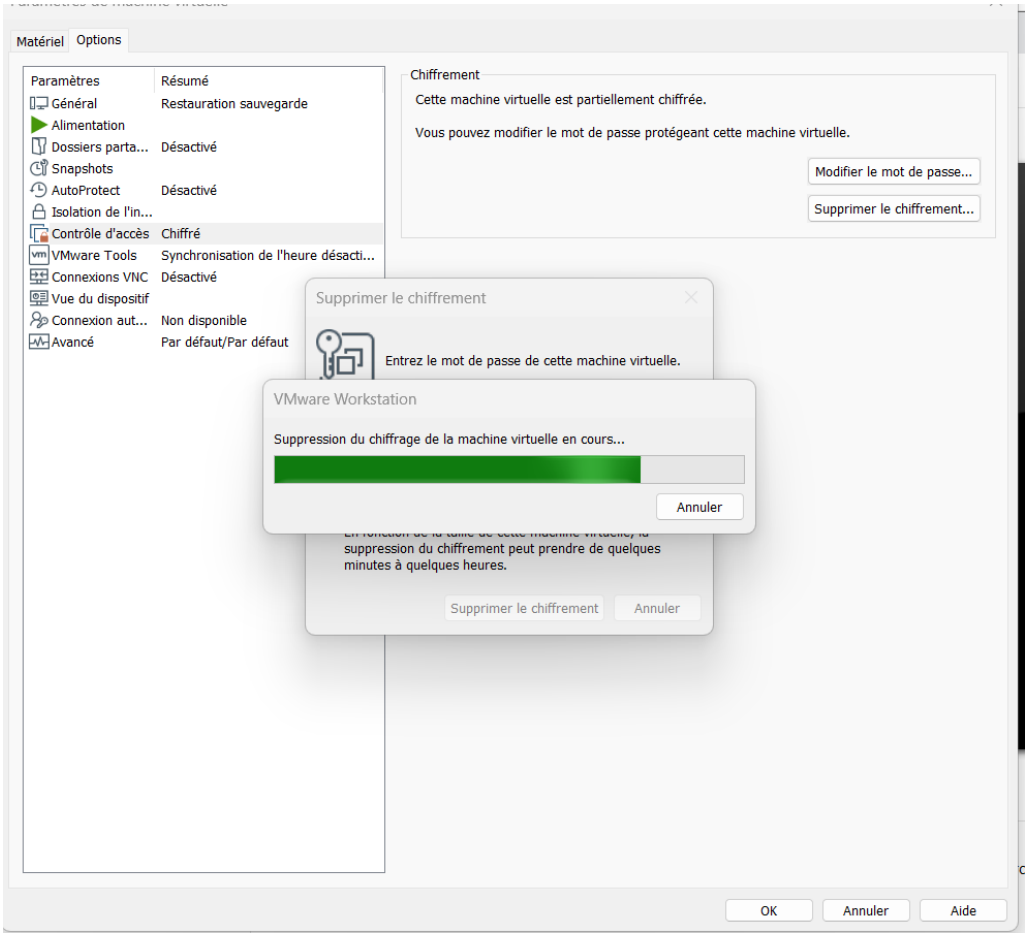

L’image a bien été créée sur le disque dur.

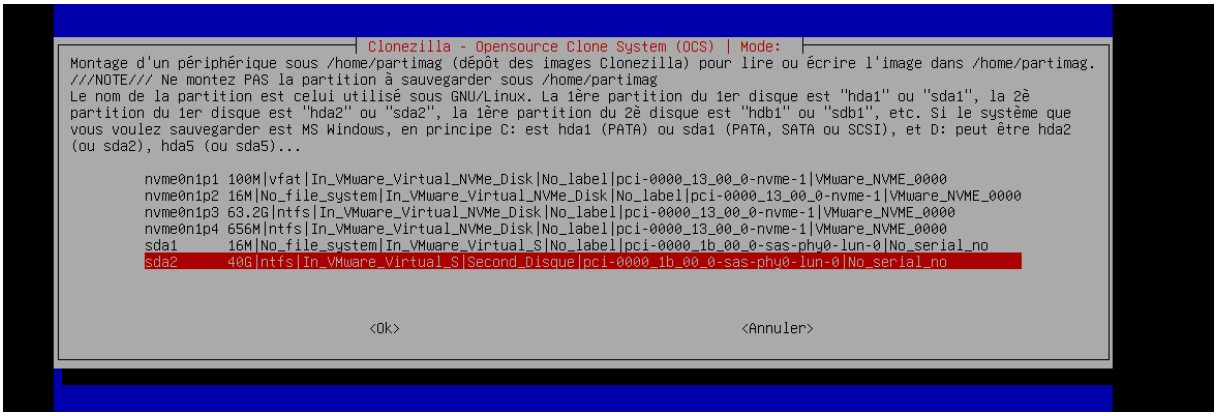

Partie 3 : Restauration d’une image disque avec CloneZilla

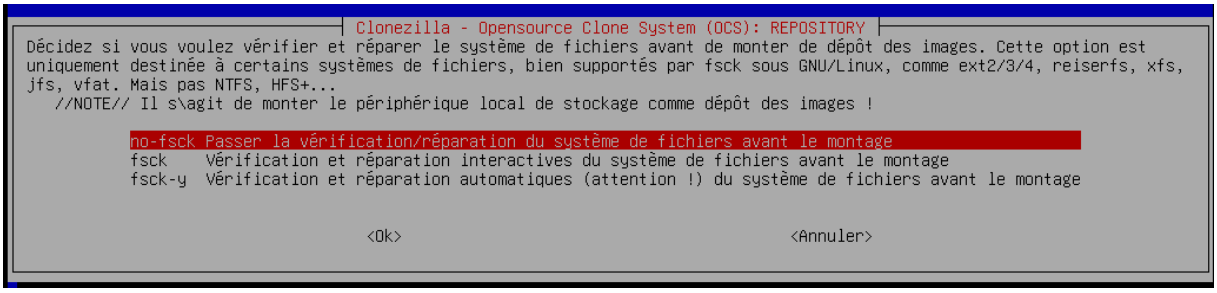

On détache le disque secondaire de 40 Go de la première VM et on le rattache à la nouvelle machine.
On doit d’abord enlever le chiffrement via les paramètres de la VM sur VMware.

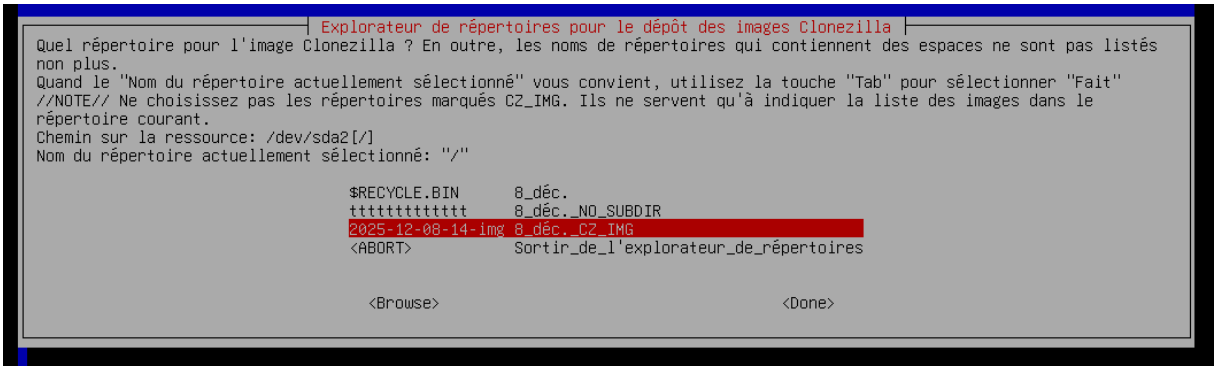

Ensuite on met l'iso dans le lecteur CD de la nouvelle VM, et on démarre dessus en passant par le bios.

On sélectionne le bon disque dur.

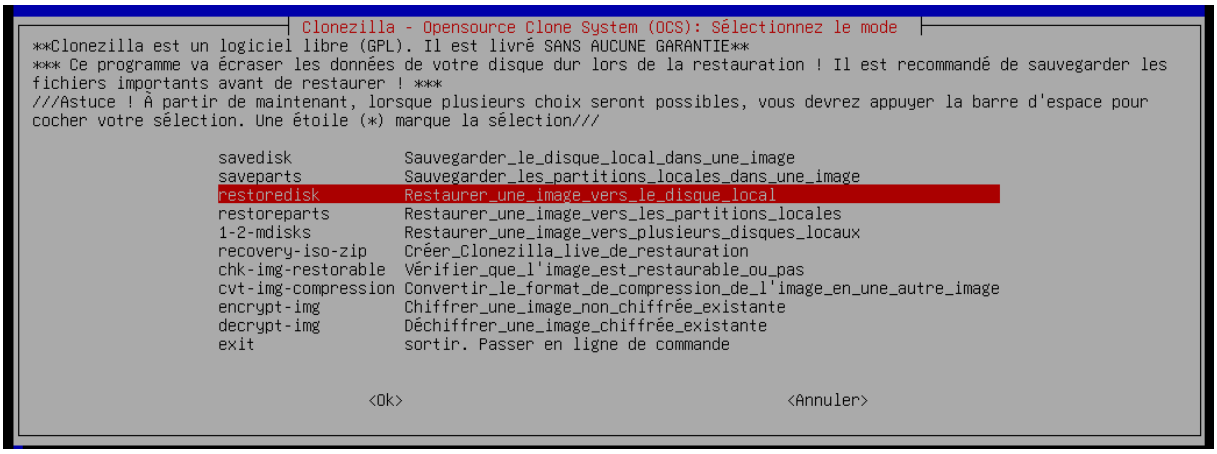

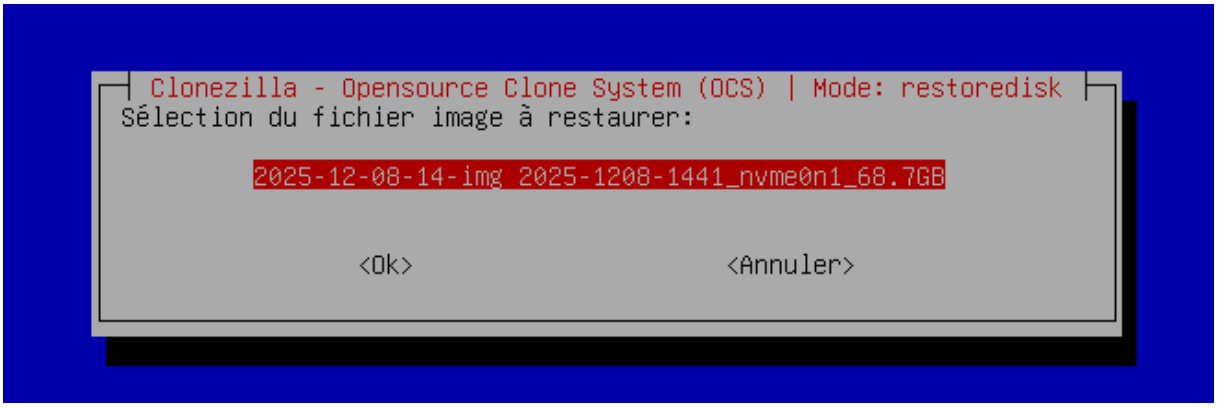

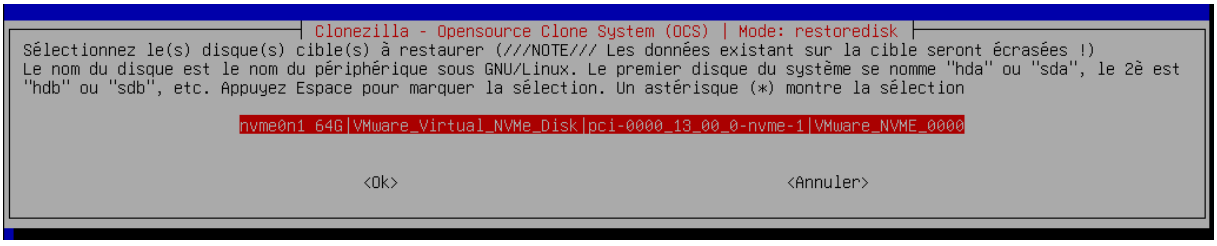

On sélectionne le dossier qui contient l'image.

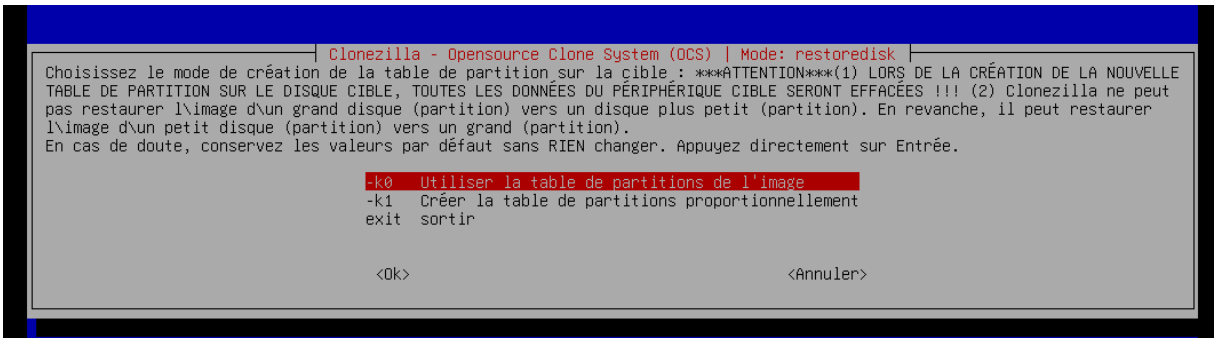

On choisit de **restaurer une image vers le disque local.**

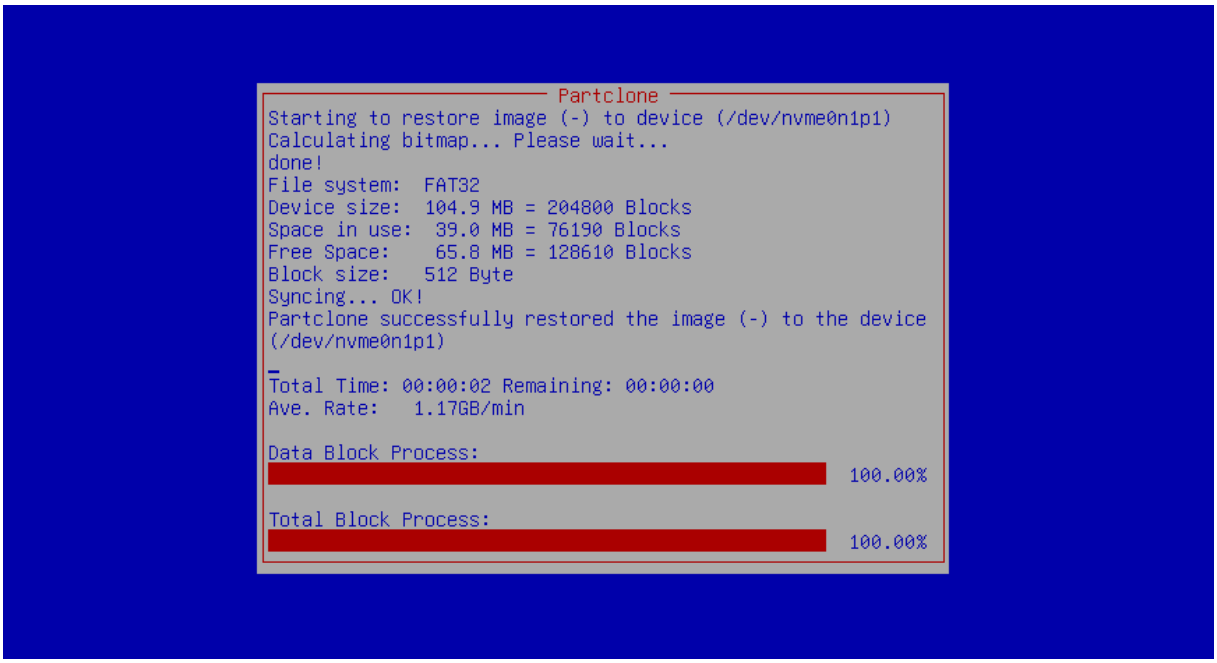

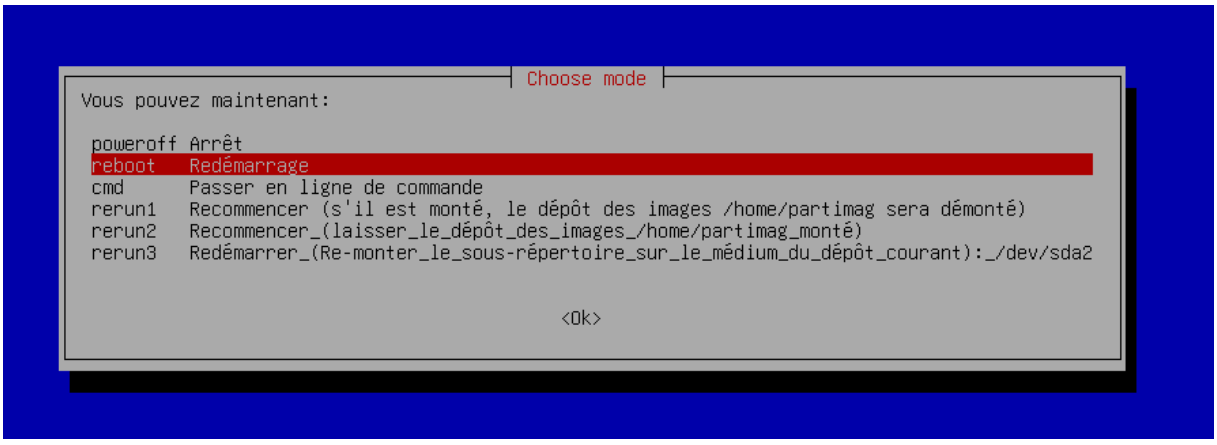

La **restauration** est en cours.

On redémarre.

Et nous voyons que tout a bien été **restauré sur le disque principal.**
